-1. FUNCTION: In the nervous system. could hydrolyze ATP and other nucleotides to regulate purinergic neurotransmission. Could also be implicated in the prevention of platelet aggregation. Hydrolyzes ATP and ADP equally well.

-1. CATALYTIC ACTIVITY: ATP + 2 H(2)O = AMP + 2 phosphate.

-1. COFACTOR: Requires calcium and magnesium (By similarity).

-1. SUBCELLULAR LOCATION: Integral membrane protein (Potential).

-1. TISSUE SPECIFICITY: Highest expression found in vascular endothelium, smooth muscle, spleen and lung.

-1. PTM: Cleaved into two polypeptides that seem to stay together by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "Distribution, cloning, and characterization of porcine nucleoside triphosphate diphosphohydrolase-1."; Eur. J. Biochem. 267:4106-4114(2000).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        16-OCT-2001 (Rel. 40, Last sequence update)

J. Biol. Chem. 271:33116-33122 (1996).

-I. FUNCTION: In the nervous system, could hydrolyze ATP and other nucleotides to regulate purinergic neurotransmission. Could also be implicated in the prevention of platelet aggregation. Hydrolyzes ATP and ADP equally well.

-I. CATALYTIC ACTIVITY: ATP + 2 H(2)0 = AMP + 2 phosphate.

-I. COPACTOR: Requires calcium and magnessium.

-I. SUBDUIT: Homodimer; disulfide-linked (By similarity).

-I. SUBCELLULAR LOCATION: Integral membrane protein (Potential).

The present sequence is the fusion protein construct, IgkappaLsolCD39.

This construct comprises of the leader peptide from human immunoglobulin of gkappa, linked to the soluble CD39 (solCD39) protein region by few residues derived from human interleukin 2 (hit2). SolCD39 has apyrase activity and is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP transmembrane domains. It retains the capacity to metabolise ATP and ADP transmembrane domains. It retains the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting anyocardial infarction, coronary artery disease or injury, embolism, atheroselerosis, peripheral vascular occlusion, precediampsia, platelet-associated ischaemic disorders including lung, coronary and cerebral schaemic disorders including coronary, peripheral and cerebral artery thrombosis, intracardiac and venous thrombosis, coronary embolism (PE) and transient ischaemic attack. Solubbe CD39 is also useful for preventing thrombus formation, reocclusion, recoclusion, stenosis or thrombus formation, occlusion, reocclusion, stenosis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 200
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240

The present sequence is the protein encoded by IgkappalsolCD39 construct.
This is used for transient expression of soluble(sol)CD39 in recombinant
CC cells for determining enzymatic activity and platelet inhibitory activity
CC for each protein product. SolCD39 is used in the treatment of unstable
angina, myocardial infarction, stroke, coronary artery disease or injury,
atherosclerosis, peripheral vascular occlusion, preeclampsia, embolism,
platelet-associated ischaemic disorder including lung ischaemia, coronary
cischaemia and cerebral ischaemia, thrombotic disorder including coronary
artery thrombosis, cerebral artery thrombosis, intracardiac thrombosis,
peripheral artery thrombosis, venous thrombosis, thrombosis,
coagulopathy, deep venous thrombosis (bTV), pulmonary embolism (PB),
transient ischaemic attack. Soluble CD39 is also useful for preventing
thrombus formation or reformation, occlusion, reocclusion, stenosis or
crestenosis of blood vessels or stroke
                                                                                     unstable angina; myocardial infarction; stroke; coronary artery disease; atherosclerosis; peripheral vascular occlusion; preeclampsia; embolism; platelet-associated ischaemic disorder; lung ischaemia; thrombotic; cerebral ischaemia; thrombotic disorder; lung ischaemia; thrombotic disorder; coronary artery thrombosis; peripheral artery thrombosis; coaquiopathy; deep venous thrombosis; peripheral artery thrombosis; coaquiopathy; deep venous thrombosis; pripheral artery thrombosis; restenosis; restenosis; antianginal; cardiant; cerebroprotective; antiarteriosclerotic; vasotropic; anticoaquiant; coronary ischaemia; vascular occlusion; IgkappaisolcD39 construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inhibiting platelet activation and recruitment, useful for treating a mammal suffering from unstable angina, myocardial infarction, stroke, coronary artery disease or injury, comprises administering soluble CD39 polypeptides.
                                                               Soluble CD39; ADP-induced platelet activation; platelet aggregation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 2368; DB 3; Length 463; Pred. The present sequence is a fusion construct, comprising the N-terminal amino acids of mature human interleukin2 (IL2) and soluble CD39 (solCD39) region, that has apyrase activity. This results in high levels of solCD39 (solCD39) cexpression and activity in the transfected cells. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It creains the apparative to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides or recruitment, including platelet aggregation. Soluble CD39 polypeptides or injury, atherosclerosis, peripheral vascular occlusion, preeclampsis, corinjury, atherosclerosis, peripheral vascular occlusion, preeclampsis, coronary and cerebral ischaemic dischaemic disorders including lung, coronary and cerebral artery thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PE) and transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                          New soluble CD39 polypeptides having apyrase activity, useful for inhibiting angiogenesis and treating unstable angina, myocardial infarction, stroke, coronary artery disease or injury.
                                                                                                                                                                                                                                                                                           6a; Page 95-97; 122pp; English.

```

The present sequence is the protein enocoded by a fusion construct of sol(soluble)CD39 having apyrase activity. Fusion of 12 amino acids from sol(soluble)CD39 having apyrase activity. Fusion of 12 amino acids from the soluble by the supernature of the soluble construction is took expression and activity in the supernatants of transfected cells. This is used in the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vasual arcordular occlusion, preeclampsia, embolism, platelet-associated ischaemia disorder including lung ischaemia, coronary ischaemia and cerebral ischaemia, thrombosis, intracardiac thrombosis, peripheral artery thrombosis, thrombosis, thrombosis, peripheral artery thrombosis, thrombosis, thrombosis, coagulopathy, deep venous thrombosis, thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PB), trambus formation or reformation, occlusion, recclusion, stenosis or thrombus formation or reformation, occlusion, recclusion, stenosis or restenosis of blood vessels or stroke

Sequence 454 AA

Claim 6; Page 95-97; 118pp; English.

```
The present sequence is the fusion protein construct, pIL2LTrim4. This construct comprises of the leader peptide from human interleukin 2 (hIL2) and soluble (D19) (sol1D39) protein region, having apprase activity.
Soluble CD19 is constructed by removing the N- and C-terminal
transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-
induced platelet activation and recruitment, including platelet aggregation. Soluble CD19 polypeptides are useful for inhibiting anyocardial infarction, coronary artery disease or injury, embolism, atherosclerosis, peripheral vascular occlusion, precelampsia, platelet associated ischaemic disorders including lung, coronary and cerebral archy thrombotic disorders including coronary, peripheral and cerebral artery thrombotic disorders including coronary, peripheral and cerebral artery thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVI), pulmonary embolism (PE) and translent ischaemic attack. Soluble CD19 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Inhibiting platelet activation and recruitment, useful for treating a mammal suffering from unstable angina, myocardial infarction, stroke, coronary artery disease or injury, comprises administering soluble CD39 polypeptides.

Example 11; Page 114-116; 118pp; English.

The present sequence is the protein encoded by Trim4 construct. pIL2Trim4 variant was constructed by removing the human IL2 residues from solCD39 tells on construct. Fusion of 12 amino acids from the N-terminus of mature human IL2 to the solCD39 coding region results in high levels of both expression and activity in the supernatants of transfected cells. SolCD39 is used in the treatment of unstable angina, myocardial infarction.

CC stroke, coronary artery disease or injury, atheorosclerosis, peripheral vascular occlusion, preeclampsia, embolism, platelet-associated ischaemic cischaemia, a thrombosis, coronary ischaemia and cerebral coronary artery thrombosis, cerebral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, venous thrombosis, thrombosis, cosquiopathy, deep venous thrombosis, thrombosis, cosquiopathy, deep venous chrombosis, cosquiopathy, deep venous companient is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke

The present sequence is the fusion protein construct, pIL2LTrim3. This construct comprises of the leader peptide from human interleakin 2 (hIL2) and soluble CD39 (solD39) protein region, having apyrase activity.

Cand soluble CD39 is constructed by removing the N- and C-terminal treatwant concentrations and the ability to block and reverse ADP- induced platelet activation and recruitment, including platelet apgregation. Soluble CD39 polypeptides are useful for inhibiting congressis It is useful for the treatment of unstable anglia, stroke, mycardial infarction, coronary artery disease or injury, embolism, aberosclerosis, peripheral vascular occlusion, precelampsia, platelet-seneoral ciscament disorders including lung, coronary and cerebral artery thrombotic disorders including coronary, peripheral and cerebral artery thrombotic disorders including coronary embolism (PE) and cerebral artery thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PE) and transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, recoclusion, recoclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        122

The present sequence is the protein encoded by Trim3 construct. pIL2Trim3 variant was constructed by removing the human IL2 residues from solCD39 fusion construct. Pusion of 12 amino acids from the N-terminus of mature human IL2 to the solCD39 coding region results in high levels of mature expression and activity in the supernatants of transfected cells. SolCD39 is used in the treatment of unstable angina, myocardial infarction, errore, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preclampsia, embolism, platelet-associated ischaemic disorder including lung ischaemia, coronary ischaemia and cerebral ischaemia, a thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, venous thrombosis, coaquilopathy, deep venous thrombosis (DE), transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or
                                                                                                                                                                                                                                                                                              unstable angina; myocardial infarction; stroke; coronary artery disease; atherosclerosis; peripheral vascular occlusion; preeclampsia; embolism; platelete-associated isofhaemic disorder; lung ischaemia; thrombolytic; cerebral ischaemia; thrombosis; coronary artery thrombosis; peripheral artery thrombosis; intracardiac thrombosis; venous thrombosis; peripheral artery thrombosis; coagulopathy; deep venous thrombosis; DVT; PS; pulmonary embolism; transfent ischaemia atters; thrombosis; DVT; escilusion; reocclusion; stenosis; restenosis; antianginal; cardiant; cerebroprotective; antiarteriosclerotic; vasotropic; anticoagulant; coronary ischaemia; vascular occlusion; pll2Trim3 variant.

the human CD39-14 N-terminal region and soluble CD39 protein. CD39-14 is a secreted apyrase, belonging to the CD39 family. Soluble CD39-14 is a secreted apyrase, belonging to the CD39 family. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting amgiogenesis. It is useful for the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, embolism, platelet-associated ischaemic disorders including coronary, peripheral and cerebral artery thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary tembolism (PE) and transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present sequence is a fusion construct of human soluble CD39 encoded by CD39-L4-1 construct. CD39-L4 is a secreted apyrase belonging to the CD39 family. The fusion construct is used for the expression and activity of soluble CD39 in CHO (chinese hamster ovary) cells. Soluble CD39 retains the capacity of wildtype CD39 to metabolise ATP and ADP at physiologically relevant concentrations as well as the ability to block and reverse ADP-induced platelet activation and recruitment including platelet aggregation. This is used in the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, patherosclerosis, peripheral vascular occlusion, precclampsia, embolism, platelet-associated ischaemia disorder including lung ischaemia, coronary ischaemia and cerebral ischaemia, thrombotic disorder including coronary
                                                                                                                                                                                                                                                                               unstable angina; myocardial infarction; stroke; coronary artery disease; atherosclerosis; peripheral vascular occlusion; preclampsia; embolism; platelet-associated ischaemic disorder; lung ischaemia; thrombolytic; cerbral ischaemia; thrombotic disorder; coronary artery thrombosis; intracardiac thrombosis, venous thrombosis; peripheral artery thrombosis; coagulopathy; deep venous thrombosis; ps. pulmonary embolism; transient ischaemic attack; thrombus formation; occlusion; stenosis; restenosis; antianial; cardiant; cerebroprotective; antiateriosclerotic; vasotropic; anticoagulant; coronary ischaemia; vascular occlusion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inhibiting platelet activation and recruitment, useful for treating a mammal suffering from unstable angina, myocardial infarction, stroke, coronary artery disease or injury, comprises administering soluble CD39 polypeptides.
                                                                                                                                                                                                                                                                        Soluble CD39; ADP-induced platelet activation; platelet aggregation;

The present sequence is a fusion construct pIL2LsolCD39, comprising the leader peptide of human interleukin 2 (HIL2), 12 amino acids from the mature N-terminus of HIL2 and soluble CD39 (solCD39) coding region, coding region, having apyrase activity. His produces high levels of solCD39 expression and activity in the transfected cells. Soluble CD39 is constructed by capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and recurrent, including platelet aggregation. Soluble CD39 polypeptides recruitment, including platelet aggregation. Soluble CD39 polypeptides recruitment, including platelet aggregation, soluble CD39 polypeptides recruitment, including platelet aggregation, soluble CD39 polypeptides unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, precelampsia, coronary and cerebral ischaemia, thrombotic disorders including lung, coronary and cerebral artery thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DYT), pulmonary embolism (PB) and transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              122

The present sequence is protein encoded by the coding region of pil2SolCD39, a funion construct encoding sol(soluble) CD39 having apyrase activity. Fusion of 12 amino acids from the N-terminus of mature human L12 to the solCD39 coding region results in high levels of both expression and activity in the supernatants of transfected cells. This is called in the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular collusion, preeclampsia, embolism, platelet-associated ischaemic disorder including lung ischaemia, coronary artery thrombosis, cerebral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, thrombosis, coagulopathy, deep venous thrombosis, (DVT), pulmonary embolism (ES), transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, custoke

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the fusion protein construct, pIL2ITrim1. This construct comprises of the leader peptide from human interleukin 2 (hIL2) and soluble CD39 (solCD39) protein region, having apyrase activity. The two regions are joined by an intervening Ala residue. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting angiogenesis. It is useful for the treatment of unstable angina, stroke, myocardial infarction, coronary artery disease or injury, embolism, atherosclerosis, peripheral vascular occlusion, preeclampsia, platelet-associated ischaemic disorders including lung, coronary and cerebral ischaemia, thrombotic disorders including coronary, embolism (PE) and transient ischaemic attack. Soluble CD39 is also useful corpusion, coronary thrombosis, (orclusion, reocclusion, recclusion, recoclusion, recoclusion, recoclusion, recoclusion, recordusion, recordusion, recordusion, recordusion, recordusion, recoclusion,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                           variant was constructed by removing the human IL2 residues from solcD39 fusion construct. Fusion of 12 amino acids from the N-terminus of mature human IL2 to the solcD39 coding region results in high levels of both expression and activity in the supernatants of transfected cells. SolcD39 is used in the treatment of unstable angina, mycardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, embolism, platelet-associated ischaemic disorder including lung ischaemia, embolism, platelet-associated ischaemic ischaemia, a thrombosis, including coronary artery thrombosis, cerebral artery thrombosis, including coronary artery thrombosis, thrombosis, coagulopathy, deep venous thrombosis (bry), pulmonary embolism (PE), transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation occlusion, reocclusion, stenosis or restenosis of blood

active fragment may be administered to treat or prevent stroke in a subject susceptible to intracranial haemorrhaging or an ischaemic alsorder. The CD39 polypeptide inhibits Abb-mediated plattelet aggregation or leukocyte accumulation andle inhibits Abb-mediated plattelet aggregation or leukocyte accumulation andle inhibits Abb-mediated plattelet aggregation subject. CD39 or its active fragment is useful for treating or preventing stroke, thrombotic disorders and ischaemic disorders such as peripheral infarction, transient ischaemic attack, unstable angina, reversible inschaemic neurological deficit and sickle cell anaemia. It is also useful for treating or preventing a stroke disorder in a subject undergoing heart surgery, lung surgery, spinal surgery, brain surgery, vascular surgery, abdominal surgery, or organ transplantation surgery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    361 KTSYAGVKEKYLSEYCFSGTYILSLILQGYHFTADSWEHIHFIGKIQGSDAGWTLGYMLN 420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   125 NYPPDFOGARIITGQEEGAYGWITINYLLGKFSOKTRWFSIVPYETNNQETFGALDLGGA 184
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating stroke in a subject susceptible to intracranial hemorrhaging an ischemic disorder, involves administering a CD39 polypeptide which inhibits ADP-mediated platelet aggregation or leukocyte accumulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present sequence is the active fragment of human CD39. Sequence 6, Application US/09835147

Patent No. US200200277A1

GENERAL INFORMATION:

APPLICANT: Maliszewski, Charles R.

APPLICANT: Gayle III, Richard B.

APPLICANT: Gimpel, Steven D.

TITLE OF INVENTION: Inhibitors of Platelet Activation and Recruitment;

FILE REFERENCE: 2879-US

CURRENT APPLICATION NUMBER: US/09/835,147

CURRENT PILING DATE: 2001-04-13

PRIOR APPLICATION NUMBER: US 60/104,585

PRIOR FILING DATE: 1998-10-16

Patent No. US20020138858A1
SEGNERAL INFORMATION:
APPLICANT: Pinsky, David J.
TITLE OF INVENTION: CD39/ECTO-ADPASE AS A TREATMENT FOR THROMBOTIC AND TITLE OF INVENTION: ISCHEMIC DISORDERS
FILE REFERENCE: 0575/59167
CURRENT APPLICATION NUMBER: US/09/374,586
CURRENT FILING DATE: 1999-08-13
NUMBER OF SEQ ID NOS: 2
SOFTWARE: Patentin Ver. 2.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
